

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

PROCEEDINGS  
OF  
THE ROYAL SOCIETY.

~~~~~  
*May 5, 1859.*

Sir BENJAMIN C. BRODIE, Bart., President, in the Chair.

In accordance with the Statutes, the President read the following list of Candidates recommended by the Council for election into the Society :—

|                               |                         |
|-------------------------------|-------------------------|
| Samuel Husbands Beckles, Esq. | William Odling, Esq.    |
| Frederick Crace-Calvert, Esq. | Robert Patterson, Esq.  |
| Henry J. Carter, Esq.         | John Penn, Esq.         |
| Douglas Galton, Esq.          | Sir Robert Schomburgk.  |
| William B. Herapath, M.D.     | Thomas Watson, M.D.     |
| George Murray Humphry, Esq.   | Bennet Woodcroft, Esq.  |
| Thomas Sterry Hunt, Esq.      | Lieut.-Col. W. Yolland. |
| John Denis Macdonald, Esq.    |                         |

The following communications were read :—

- I. “Propositions upon Arithmetical Progressions.” By F. ELEFANTI, Esq. Communicated by ARTHUR CAYLEY, Esq.  
Received April 6, 1859.

(Abstract.)

The author sketches the investigation of the way of throwing various series of integer terms into arithmetical progressions, such as the sums of squares, cubes, &c. of figurate numbers, of the powers of a number, &c. He also gives the resolution of a given number,

in certain cases, into an arithmetical progression. Thus, having the theorem that  $N$  can be resolved into an arithmetical progression when  $16N+1$  is a square, he is enabled to detect factors in  $N$ ; he thus shows that 2079519603 has 43 and 101 among its factors. Among theorems which the method gives, may be noticed the following, as one of a peculiar and unstudied class. If in the series 1, 3, 5, 7, &c. four terms be taken, and the next *one* omitted, then the four next terms taken and the next *three* omitted, then four terms taken and *five* omitted, and so on, the four terms taken will in every case consist of numbers prime to one another.

II. Abstract of a Memoir "On the Electric Properties of Insulating or Non-conducting Bodies." By Professor CARLO MATTEUCCI of Pisa. Communicated by Major-General SABINE, R.A., V.P. and Treas. R.S. Received April 14, 1859.

The object of the author in the first part of this memoir is to ascertain by experiment what condition is assumed by insulating or non-conducting bodies in the presence of an electrified body, and in what degree such condition is developed in insulating bodies of different kinds. In a memoir published nearly ten years ago (*Ann. de Chim. et de Phys.*, xxvii. p. 134), he had shown that a cylinder of gum-lac, sulphur, stearic acid, or the like, suspended by a filament of silk, and brought near to a body charged with electricity, begins to oscillate in the same way as a cylinder of metal. The non-conducting cylinder, whilst under the influence of induction, behaves like any body charged with opposite electricities, and returns to its natural state when the induction ceases.

These experiments have now been very carefully repeated with cylinders formed of various insulating substances, made as nearly as possible of the same length and perfectly diselectrized. The air was rendered perfectly dry, and the inducing ball was charged with electricity to a constant degree, measured by the torsion-balance.

After giving a numerical statement of the time of oscillation and the moment of the induced force, as determined by experiment for cylinders of different insulating substances, and after describing other
